

Changing Application Fonts on Unix

Note: The following information only applies to Seapine License Server, Surround SCM, and TestTrack 2015.1 and earlier.

If you are running Seapine License Server, Surround SCM, or TestTrack clients on Unix, you can change the default font. This change affects all Qt applications that you run.

Qt includes a utility, `qtconfig`, that can be used to set the default font for all Qt applications. These defaults are saved in a `$HOME/.qt/qtrc` file. You can also edit the `$HOME/.qt/qtrc` file manually to set a default font.
