

SOAP Deprecated Messages

The SOAP-based [TestTrack SDK](#) provides a way for you to remotely make method calls on the classes and objects that exist on a remote server. It provides an interface into TestTrack that allows external applications and users to send, retrieve, save, and update business object (e.g., defect, test case, user information). SOAP specifies a standard way to encode parameters and return values in XML, and standard ways to pass them over some common network protocols.

Following is a list of deprecated messages and types and their replacements.

Deprecated:	Replace with:
ArrayOfCDatabase	ArrayOfCProject
ArrayOfCDefectEvent	ArrayOfCEvent
ArrayOfCDefectEventDefinition	ArrayOfCEventDefinition
CDefectEvent	CEvent
CDefectEventDefinition	CEventDefinition
DatabaseLogon	ProjectLogon
getDatabaseList	getProjectList

Note: CDefectEvent was deprecated in TestTrack 7.6. After you replace CDefectEvent with CEvent, you may need to rebuild the stub file or rebind with the latest TestTrack WDSL file.
