

Adding Sample Projects to the TestTrack Server

If you want to add a [sample project](#) to your TestTrack Server, you need to add the project files to the server, add the project to the projects list, and provide access to users who need to use the sample project.

1. Unzip the sample project into the TTDbs directory in the TestTrack application directory on the server computer. The default locations are:
 - ◆ Windowsâ C:\Program Files\Seapine\TestTrack\TTServDb\TTDbs
 - ◆ Linuxâ /var/lib/TestTrack/TTServDb/TTDbs
2. Start and log in to the TestTrack Server Admin Utility.
3. Choose View > Projects.
4. Click Add Existing.
5. Click Browse, select the project you added, and click OK.
6. Click OK to add the project.
7. Start the TestTrack Client.
8. Log in as an administrative user and select the new project.
9. Add security groups and users to the project.
