

# Windows Versions and Surround SCM Working Directories

If you use Windows Vista or Windows 7, do not set the Surround SCM working directory to any location in the following folders:

- C:\Program Files
- C:\Program Files (x86)

**Note:** The file paths assume Windows was installed in C:\.

## Known issues

When you get files to your working directory, Windows may silently deny write access to the location and redirect the files to a virtual store in C:\Users\username\AppData\Local\VirtualStore.

The Open Containing Folder command may not work if Windows has redirected files to a virtual store.
