

Web Controls Not Displayed in Preview Screenshots

Problem

A web application control selected in the QA Wizard Pro application repository is either not displayed in the screenshot image in the Preview pane or the red box that highlights controls is displayed in a blank area below the image.

Cause

During recording, QA Wizard Pro captures a screenshot of the portion of the web page displayed on the screen when you interact with a control. If the control was not in the visible portion of the web page, it is not displayed in the preview image.

Solution

Record a test script to update the preview images.

1. Choose Tools > Options.
2. Select the 'Update preview images when recording' option.
3. Click OK.
4. Record a test script against the web page to capture new preview images.
