

# Remote Playback Support

QA Wizard Pro only supports remote playback through QAWRemote.exe. Other configurations are not supported. For example, you cannot start virtualization software, such as Citrix, from QA Wizard Pro on a Windows Vista computer and run scripts against an application on a Windows 2003 computer.

If you are testing a web application, the web server can be hosted on a remote computer, but the browser must be on the same computer as QA Wizard Pro.

To run scripts remotely, QA Wizard Pro must be installed and QAWRemote.exe must be running on the remote computer. The remote computer must also have access to the application in the global or local application repository. See the [QA Wizard Pro help](#) for information about running scripts remotely.
