Differentiating Applications with the Same Name in QA Wizard Pro Application Repositories

Problem

The following warning is displayed when running a QA Wizard Pro script:

'Local and global repository entries were found for 'application name'. The local repository was used.'

Cause

The application the script accesses has the same name in the local and global application repositories.

Solution

Modify the SetContext statement in the script to indicate whether to use the local or global repository. Add Global: or Local: before the application name.

For example:

```
SetContext("Global:WysiCorp Login/1.0")
SetContext("Local:WysiCorp Login/1.0")
```

-or-

Change the application name in either repository.
