

Cannot Connect to a QA Wizard Pro Global Repository Hosted on Windows Vista

Problem

If the QA Wizard Pro global repository server is hosted on Windows Vista and the server computer is locked, computers connected to the global repository are disconnected after a period of time. QA Wizard Pro cannot reconnect to the global repository server, even after clicking the Connect link in the Application Repository pane.

Cause

By default, Windows Vista puts the computer to sleep after a period of inactivity, which disrupts the global repository connections.

Solution

Disable sleep mode on the Windows Vista computer that hosts the global repository server.

1. Click the Start button and choose Control Panel.
2. Click System and Maintenance.
3. Click Power Options.
4. Click Change when the computer sleeps.
5. Change the Put computer to sleep option to Never.
6. Click Save Changes.
