

Silverlight Applications Crash in Firefox When Recording or Running QA Wizard Pro Scripts

Note: The following information only applies to QA Wizard Pro 2016.1 and earlier.

Problem

When recording or running QA Wizard Pro scripts, Microsoft Silverlight applications running in Mozilla Firefox 3.6.4 or later crash when a message box is displayed.

Cause

Using the `MessageBox.Show` method to display Silverlight message boxes causes Firefox to become unresponsive or plugins running in Firefox to crash. This is a known Firefox issue.

Solution

Record and run scripts that test Silverlight message boxes in a [supported version of Internet Explorer](#).

You can also replace the `MessageBox.Show` method with a custom `ChildWindow` class. See the Silverlight help for information.
